The ubiquitin-conjugating system comprises: (a) a reconstituted protein mixture including a ubiquitin conjugating enzyme (UDCE) produced by the expression of a nucleic acid which hybridizes under high stringency conditions to human UDCE, Candida albicans UDCE, or Schizosaccharomyces pembe UDCE coding sequences; (b) a regulatory protein; and (c) ubiquitin. The polynucleotides are useful for identifying ubiquitination inhibitors. The polynucleotides, polypeptides, antisense compounds and antibodies against them may also be useful for the treatment and/or diagnosis of proliferative disorders (e.g. cancer, atherosclerosis, or restenosis), tissue connective disorders, controlling wound healing, and disorders characterized by fibrosis (e.g. rheumatoid arthritis, insulin dependent diabetes mellitus, glomerulonephritis,
                                                                                                            HPV-18 E6; ubiquitin mediated proteolysis; human; cellular protein half life; ubiquitination inhibitor; p53; cyclin; cell cycle regulator; myc deregulation; human papillomavirus; cell cycle regulator; myc deregulation; human papillomavirus; HPV-18 E6 protein; cervical cancer; skin cancer; epidermal hyperplasia; epidermal neoplasia; psoriasis; connective tissue disorder; wound healing; cytostatic; antiproliferative; anticancer; antipsoriatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 158 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cirrhosis, and scleroderma)

cu ubiquitin-mediated proteolysis of a cell cycle regulatory protein comprising contacting an engineered eukaryotic cell with a candidate cagent. The eukaryotic cells is engineered to express a recombinant human, candida albicans or Schizosaccharomyces pombe ubiquitin- conjugating companies (AAB03169-B03171), a cell cycle regulatory protein (such as p53) cand schizosaccharomyces pombe ubiquitin- conjugating captures, https://doi.org/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/10.2016/1

                                                                                                                                                                                              treatment or prophylaxis of HPV infection, in persons who have not can manifested symptoms e.g. genital warts or neoplastic growth. The peptides can also be used in a tetramer staining assay to assess peripheral blood mononuclear cells for the presence of antigen-specific CTLs following exposure to a pathogen or immunogen, and as reagents to evaluate immune recall responses or evaluate the efficacy of a vaccine. The vaccine compositions are useful for removing warts or treating HPV infections. The epitopes for inclusion in an epitope-base vaccine may be selected from conserved regions of viral or tumour-associated antigens, which reduces the likelihood of escape mutants, also immunosuppressive epitopes that may be present in whole antigens can be avoided with the use of epitope-base vaccines. An additional advantage is the ability to combine selected epitopes (CTL and HTL) and to modify the composition of the epitopes achieving enhanced immunogenicity, the major benefit of the vaccine is that is safe and efficacious.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an isolated prepared human papillomavirus (HPV) epitope (I). (I) has antivital activity, and can be used in vaccine production. Peptides and corresponding nucleic acid compositions from the present invention are useful for stimulating an immune response to HPV by stimulating the production of CTL or HTL responses, specifically in the
                                                                                                                                                                                              Sequence 158

                               ADO44074-ADO44085 represent E6 polypeptides from human papillomaviruses. ADO44098 is the consensus sequence derived from these polypeptides. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV) -associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       E6 protein; E7 protein; fusion protein; HPV; HPV-associated cancer; cervical cancer; immune response; lower gastrointestinal tract cancer, anal cancer; reproductive system cancer; penile cancer; vulvar cancer

                                                                                                                                                                                                                                                                            The invention relates to an antibody composition comprising a mixture of CC monoclonal antibodies that specifically bind to E6 proteins of human CC papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least one CC of the monoclonal antibodies specifically binds to E6 proteins of at CC least three different oncogenic HPV strains. Also included are a CC diagnostic kit (for detecting an HPV E5 polypeptide in a sample, CC comprising the antibody composition above), a method of detecting an HPV CC E6 protein in a sample, a method of detecting the presence of an oncogenic HPV E6 protein in a sample for detecting the CC presence of an oncogenic HPV E6 protein a system for detecting the CC presence of an oncogenic HPV E6 polypeptide in a sample (comprising a CC first and a second binding partner for an oncogenic HPV E6 polypeptide, CC where the first binding partner is a PDZ domain protein and the second CC binding partner is an antibody the specifically binds to the E6 proteins of at least three different oncogenic HPV strains). The antibody CC composition, kit, methods, and system are useful for diagnosing cancer, CC particularly cervical cancer. The present sequence is an HPV E6 protein.

                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of producing a synthetic protein comprising an amino acid sequence that is at least 80% identical to a comprising an amino acid sequence that is at least 80% identical to a comprising antigenic protein of a pathogen or tumor comprising chemically synthesizing two or more fragments, chemically ligating the C-terminus of a fragment to the N-terminus of a neighboring fragment to ground to the synthetic protein or its part and optionally repeating the comproduce the synthetic protein or its part and optionally repeating the composition of step to sequentially ligate a further neighboring fragment to obtained from the second step. The invention also relates to a composition comprising the protein and a method for treating or composition comprising the protein and a method for treating or to the subject the protein or composition in a therapeutically effective amount. In producing a synthetic protein, the neighboring non-overlapping fragments are selected to comprise N-terminal cysteine or glycine capacities. The naturally occurring protein is an HPV4 protein, e.g. E2, E6 or E7 protein from HPV16, HPV18, HPV33 or HPV45. The composition of useful as a vaccine for preventing or treating HPV associated disease, such as a concer. This sequence represents an HPV18 E6 protein used in the method capacity in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                 Chesnut Chen Y,
                   multi-epitope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the polynucleotide, vector and/or polypeptide and a carrier), a cell (comprising the polynucleotide, vector or polypeptide), inducing an immune response against human papillomavirus virus (HPV) and making the polynucleotide, vector or polypeptide. The epitopes are derived from different strains of HPV and are from the El, E2, E8 and E7 proteins. The epitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune response against human papillomavirus virus (HPV) and thus providing a defense against HPV infection and HPV-related cancers. The present
                                                                                                                                                                                                         The invention relates to a new polynucleotide comprising a multi-epitope construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic Tlymphocyte (CTL) epitopes e.g., HPV16 EB1.214, and that are directly or indirectly joined to one another in the same reading frame, a vaccine minigene. Also included are a vector comprising the
                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2005-658982/67.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WO2005089164-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human papillomavirus type 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human papilloma virus infection; virucide; cancer; cytostatic; vaccine; epitope mapping; immune stimulation; cytotoxic T-lymphocyte.

                                                                                                 A new DNA sequence encoding a fusion protein comprising a mutagenized HPV (human papillomavirus) E6 or E7 coding sequence and a sequence encoding a highly immunogenic fusion partner is useful to vaccinate against HPV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            multi-epitope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the polynucleotide, vector and/or polypeptide and a carrier), a cell (comprising the polynucleotide, vector or polypeptide), inducing an immune response against human papillomavirus virus (HPV) and making the polynucleotide, vector or polypeptide. The epitopes are derived from different strains of HPV and are from the El, E2, E6 and E7 proteins. The epitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune response against HPV infection and HPV-related cancers. The present sequence is an HPV protein used to derive epitopes for the vaccine of the
                                    Disclosure;

The invention is used as a vaccine for the prevention or treatment of an HPV infection or a neoplasm associated with HPV E66T-protein sequence represents the human papillomavirus-18 (HPV18)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PCR from plasmid pbR322/HPV16 (Boshart et al., EMBO J. 3: 1151) using oligonucleotides SO1 and SO2. The porod. of the second reading frame is the HPV-18 E7 protein whereas the third reading frame encodes HPV-18 E6. The E6 and E7 ORFs are fused together to form a single continuous ORF via site directed mutagenesis and the immorthising potential of E7 is removed by altering two key codons of the HPV E7 sequence. The single ORF of HPV-18 E6/E7 may be inserted into vaccinia virus DNA at neutral sites (pref. by inserting two sets of the DNA in opposite orientations to overcome the problem of intertypic recombination) to make a recombinant virus vector for use immunotherapeutically to activate cells of the immune system against HPV. ```

AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAY25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 oligonucleotide. The products of the invention can be used to immune response in a patient to an HPV antigen. They can also preventing or treating HPV induced tumours
                                             This sequence represents a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Haemophilus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immunotherapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.                                                                                      The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence represents an HPV-H. influenzae D protein, fusion protein of the

                                                                                                                                                                                                                                                                                                                    AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAY25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonuclectide. The products of the invention can be used to induce arimmune response in a patient to an HPV antigen. They can also be used i preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       VAH

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a chimeric B6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Haemophilus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immunotherapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence represents an HPV-H. influenzae D protein, fusion protein of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an antibody composition comprising a mixture of CC monoclonal antibodies that specifically bind to E6 proteins of human CC papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least one of the monoclonal antibodies specifically binds to E6 proteins of at CC diagnostic kit (for detecting an HPV E8 polypeptide in a sample, CC comprising the antibody composition above), a method of detecting an HPV CE protein in a sample, a method of detecting the CC presence of an oncogenic HPV E6 polypeptide in a sample (comprising the concogenic HPV E6 protein and a system for detecting the concogenic HPV E6 protein and a system for detecting an CC first and a second binding partner for an oncogenic HPV E6 polypeptide, where the first binding partner is a PDZ domain protein and the second CC binding partner is an antibody that specifically binds to the E6 proteins of at least three different oncogenic HPV Extrains). The antibody composition, kit, methods, and system are useful for diagnosing cancer, CC particularly cervical cancer. The present sequence is an HPV E6 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for generating an immune response to an antigen in a patient. The method comprises administering to the patient an immunoglobulin (Ig) or its portion where the Ig has at least one peptide epitope of the antigen attached to the Ig or its portion and administering the immunoglobulin or its portion in conjunction with a RNA segment. The present sequence is an antigen sequence, used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Generating an immune response to an antigen, useful for generating desired T cell responses comprises administering an immunoglobulin one peptide epitope of the antigen attached to the immunoglobulin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AD044074-AD044085 represent E6 polypeptides from human papillomaviruses. AD044098 is the consensus sequence derived from these polypeptides. The specification describes human papillomavirus E6 and E7 polypeptides. The where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in AD044073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in AD044072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                            ş
                                                                                                                                                                                                                                                                                                                          CC mammal to either: a conjugate comprising a preselected antigen covalently CC bound to an antibody to DEC-205; or a recombinant anti-DEC-205 antibody CC genetically engineered to contain at least one preselected antigen on at CC least one preselected site on the antibody molecule; and promoting CC antibody (fragment) is preferably selected from ADV85632 and ADV85633, CC which encode the heavy or light chain variable region of an anti-DEC-205 CC antibody. The antigen is targeted to antigen presenting cells through the CC inclusion of the anti-DEC-205 antibody, The anti-DEC-205 antibody, The inmunity induced is robust and long lasting, even CC from a single dose at low concentration. The method of the invention is CC used an anti-DEC-205 a mammal to prevent or treat a disease such as a CC viral, bacterial or other infection or cancer. The immunization and CC immunity. The present sequence is a HPV protein sequence which can be CC used as a variance anticen.
